Trainer

AP Dr Freddy Yeo Kuok San

**PhD in Plant Science, Wageningen
University, The Netherlands**

Rice landraces in Sarawak are valued for their adaptability and grain quality but often show variability in yield and vulnerability to pests, diseases, and climate change. Mass selection is a simple, farmer-friendly breeding method that involves selecting superior plants. Over time, this approach enhances crop performance within the population. This workshop equips farmers with knowledge in plant selection, and field evaluation, supporting community-based breeding of resilient, locally adapted rice varieties for sustainable production and improved livelihoods.

Workshop Content

1. Understand variations in paddy field
2. Identify desirable traits
3. Apply mass selection techniques
